

Lesson 3

Resistors in Series and parallel

We looked at circuits with one resistor now we look at combinations of resistors. These configurations will look familiar.

Series Connection

To calculate resistors in series, you add the resistances together.

Formula: $R_t = R_1 + R_2 + R_3 + R_4 \dots n$

Example: R1, R2, R3 and R4 are 1.5 kΩ and are connected in series. What is the total resistance?

$$R_1 + R_2 + R_3 + R_4 = 1.5 \text{ k}\Omega + 1.5 \text{ k}\Omega + 1.5 \text{ k}\Omega + 1.5 \text{ k}\Omega = 6 \text{ k}\Omega$$

Resistors in parallel will result in less than the smallest resistor value.

Parallel Connection

Formula: $\frac{1}{R_t} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3} \dots n$

Example: R1, R2, R3 and R4 are 1.5 kΩ and are connected in parallel. What is total resistance?

$$\begin{aligned} 1/R_t &= 1/1500 + 1/1500 + 1/1500 + 1/1500 \\ &= 0.00066 + 0.00066 + 0.00066 + 0.00066 \\ &= 0.0026 \\ R &= 1/0.0026 \\ &= 384.61\Omega \end{aligned}$$

Resistor colour codes

Resistors can be very small, so the value of the resistor is painted in bands around the resistor. There can be 3, 4, 5, or 6 bands and each colour represents a specific value. Surface mounted resistors have a different numbering sequence due to their small size.

Colour	1 st Digit	2 nd Digit	3 rd Digit	Multiplier	Tolerance	Temp Coefficient
Black	0	0	0	1Ω	N/A	N/A
Brown	1	1	1	10Ω	± 1% (F)	100
Red	2	2	2	100Ω	± 2% (G)	50
Orange	3	3	3	1kΩ	± 3%	15
Yellow	4	4	4	10kΩ	± 4%	25
Green	5	5	5	100kΩ	± 0.5% (D)	N/A
Blue	6	6	6	1MΩ	± 0.25% (C)	10
Violet	7	7	7	10MΩ	± 0.10% (B)	5
Grey	8	8	8	100MΩ	± 0.05% (A)	N/A
White	9	9	9	1GΩ	N/A	N/A
Gold				0.1Ω	± 5% (J)	N/A
Silver				0.01Ω	± 10% (K)	100

1. In a three-band resistor colour codes, there is no tolerance band, so 20% is assumed.
2. In four band resistor colour codes the tolerance band is used.
3. In the case of five band and six band resistor colour codes, the 5th band code is used for tolerance in percentages.
4. The temperature coefficient in parts per million/ Degrees Celsius(ppm/°C) tells the change in the resistance value with temperature.

Australian Amateur Radio Advance Licence Theory

A mnemonic to remember these numbers is,

Better Be Ready Or Your Great Big Venture Goes West.

Black Brown Red Orange Yellow Green Blue Violet Grey White

Or

Big, Beautiful Roses Occupy Your Gardens, But Violets Grow Wild.

Black, Brown Red Orange Yellow Green Blue Violet Grey White

Resistor Sizes

Resistor sizes are not infinite by 1 ohm increments. They are divided into E-series sets of preferred values. E 12 is the most common series. E12 means that every decade (0.1-1.0, 1-10, 10-100, 10etc.) is divided in 12 steps on a logarithmic scale. The size of every step is equal to:

$$10^{\left(\frac{1}{12}\right)} = 1.21$$

Based on this, every value is 21% or 1.21 times higher than the previous value in the series, rounded to whole numbers. All resistors with a tolerance of 10% overlap. The series looks as follows: 1– 1.2 – 1.5 – 1.8 – 2.2 – 2.7 – 3.3 – 3.9 – 4.7 – 5.6 – 6.8 – 8.2 – 10 etc.

One decade of the E12 series

Resistor Power Rating

The power rating of a resistor is measured in watts, and it's usually between 1/8W (0.125W) and 1W. Resistors with power ratings of more than 1W are usually referred to as power resistors, resistors and specifically for their power dissipating abilities.

Resistor Types

Resistors come in various designs.

Fixed Resistors

Are resistors whose value is predetermined and marked with colour bands.

Australian Amateur Radio Advance Licence Theory

Variable Resistor (Sometimes called a Potentiometer or Pot)

Is a resistor whose value can be varied through a specified range.

Wire Wound Resistors

These are usually special resistors designed to dissipate a lot of heat.

Print a copy of the Lesson 3 practical answer template and undertake the practical exercise.

Once the practical is completed, answer the Lesson 3 questions.

Have fun and stay safe.
